

MEETING THE CHALLENGES OF GROUNDWATER IN FRACTURED ROCK

September 21-22, 2026 • Burlington, Vermont

This NGWA conference, held every two to three years, has become the leading forum bringing together a broad spectrum of experts to discuss the most effective approaches to deal with the most challenging geologic environment to characterize and remediate - fractured rock, including karst. To meet these challenges, environmental science has progressed significantly in this realm in recent years. New tools and technologies provide numerous options that groundwater professionals can employ to characterize even the most challenging sites for remediation and sustainable water supply.
